OPEN-SOURCE CHROME EXTENSION · V2.0

Scopus AI Scanner V2 — Complete Step-by-Step Tutorial

Bulk-scan 100 Scopus abstracts per page without touching your mouse, then grade every paper against your own thesis topics and rubric using the free Google Gemini API.

Non-Intrusive Background Scanning
All scrolling and abstract expanding happens inside the Scopus tab DOM. Your mouse, keyboard, and other tabs/apps stay 100% under your control.

Flexible for Any Thesis Topic
Define your own topics (e.g., Topics A–F), keywords, 0–3 rubric criteria, and 15+ deep-note fields—or let AI suggest topics from your thesis title.

Quick Overview of the Workflow

Step	Where	What Happens
1. Install	`chrome://extensions`	Load the unpacked folder in Chrome or Edge (takes 30 seconds).
2. Free API Key	Dashboard → Settings	Paste a free Google AI Studio key (no credit card or billing required).
3. Topics & Rubric	Dashboard → Topics & Rubric	Enter your thesis title, topics (or load a preset), keywords, and grading criteria.
4. Scan Scopus	Scopus search page (100/page)	Click **Scan this page** → **Dashboard** on the bottom-right floating pill.
5. AI Grading	Dashboard → Papers	Preview the 100 scanned papers, then click **Start AI evaluation**.
6. Matrix & Export	Dashboard → Grading Matrix / Export	Inspect Tier 1/2/3 counts per topic and export to Excel (`.xlsx`), CSV, or BibTeX.

Step 1 — Install the Extension in Chrome (or Edge)

1. Download or clone the `Scopus-AI-Scanner-V2` folder to your computer.
2. Open Google Chrome and navigate to `chrome://extensions` in the address bar.
3. Turn ON the **Developer mode** toggle in the top-right corner.
4. Click **Load unpacked** (top-left button) and select the `Scopus-AI-Scanner-V2` folder.
5. Click the puzzle-piece Extensions icon in your Chrome toolbar and **pin** *Scopus AI Scanner V2* for quick access.

Step 2 — Get a Free Gemini API Key (No Credit Card Needed)

1. Visit `https://aistudio.google.com/apikey` and sign in with any regular Google account.
2. Click **Create API key** and copy the generated key (starts with `AIza...`).
3. Click the **Scopus AI Scanner V2** icon in Chrome → **Open dashboard** → open the **Settings** tab.
4. Paste your key into **API key**, keep the interval at **4 seconds** (safe for the 15 requests/minute free tier), click **Save settings**, and click **Test key** to confirm it works.

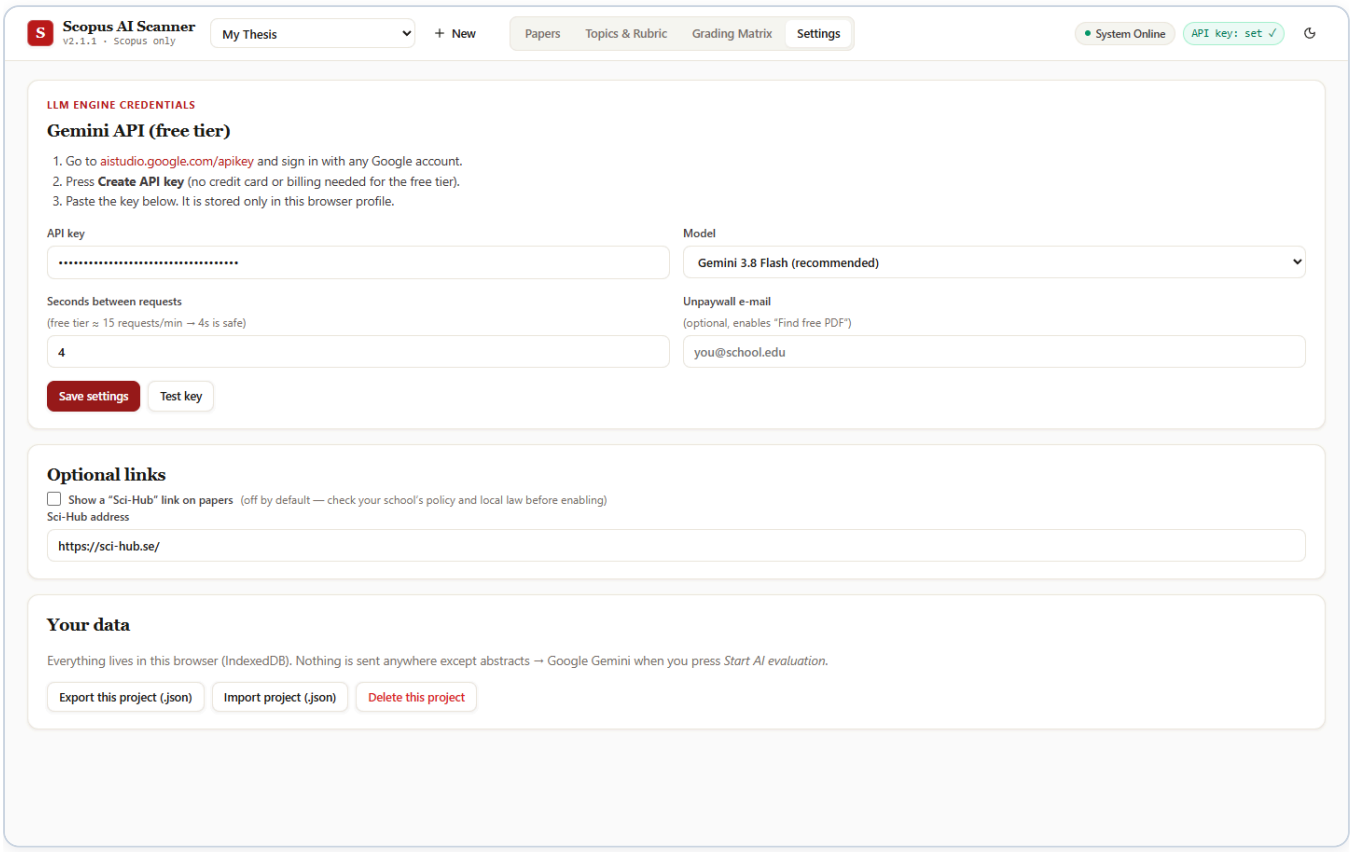

Figure 1 — Dashboard Settings tab: paste your free Google AI Studio key and click Test key.

Step 3 — Set Up Your Thesis Topics, Keywords & Grading Rubric

Open the **Topics & Rubric** tab in the dashboard. Unlike fixed scanners, V2 lets you create separate projects for different courses or theses using the project selector in the top bar.

- **Start from scratch or use a preset:** Enter your *Project name*, *Thesis title*, and a short *Study context*, or choose a preset (such as the 6-topic PV-Battery-Supercapacitor Microgrid sample) and click **Load preset into this project**.
- **AI Topic Generator:** Have only a thesis title? Click ✨ **Suggest topics & keywords with AI** and Gemini will propose literature-review sections and Scopus search keywords for you.
- **One-Click Scopus Search String:** Inside each topic card, click ⚙ **Build from keywords** or 📋 **Copy & open Scopus advanced search** to launch Scopus with a ready-made `TITLE-ABS-KEY(...)` query.

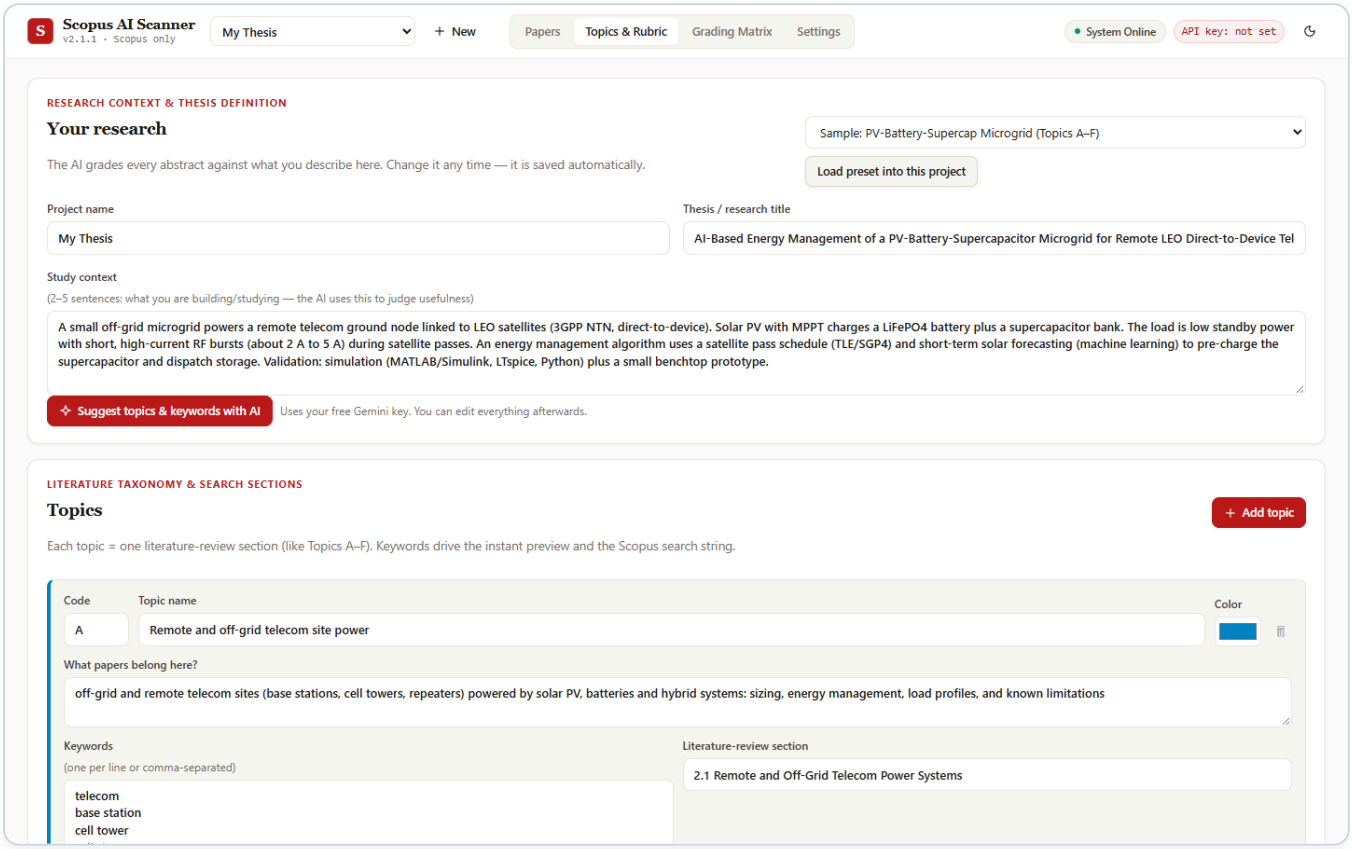

Figure 2 — Topics & Rubric tab: configure your thesis context and custom Topics (A–F or your own).

Customizing the 0–3 Rubric and Deep-Note Extraction Fields

Scroll down on the **Topics & Rubric** tab to tailor how each paper is graded and what notes are extracted:

- **Grading rubric:** By default, the AI grades *Topic Match (0–3)*, *Method Usefulness (0–3)*, and *Evidence Quality (0–3)*, plus an automatic *Recency (0–3)* score based on publication year (max 12 points; Tier 1 ≥ 75%, Tier 2 ≥ 50%). You can add, edit, or remove criteria at any time.
- **Deep-note fields:** Customize the 10–15 structured fields the AI extracts from every abstract (e.g., objective, methodology, system/dataset scale, validation type, quantitative metrics, equations/parameters, limitations, research gap, and suggested RRL section).

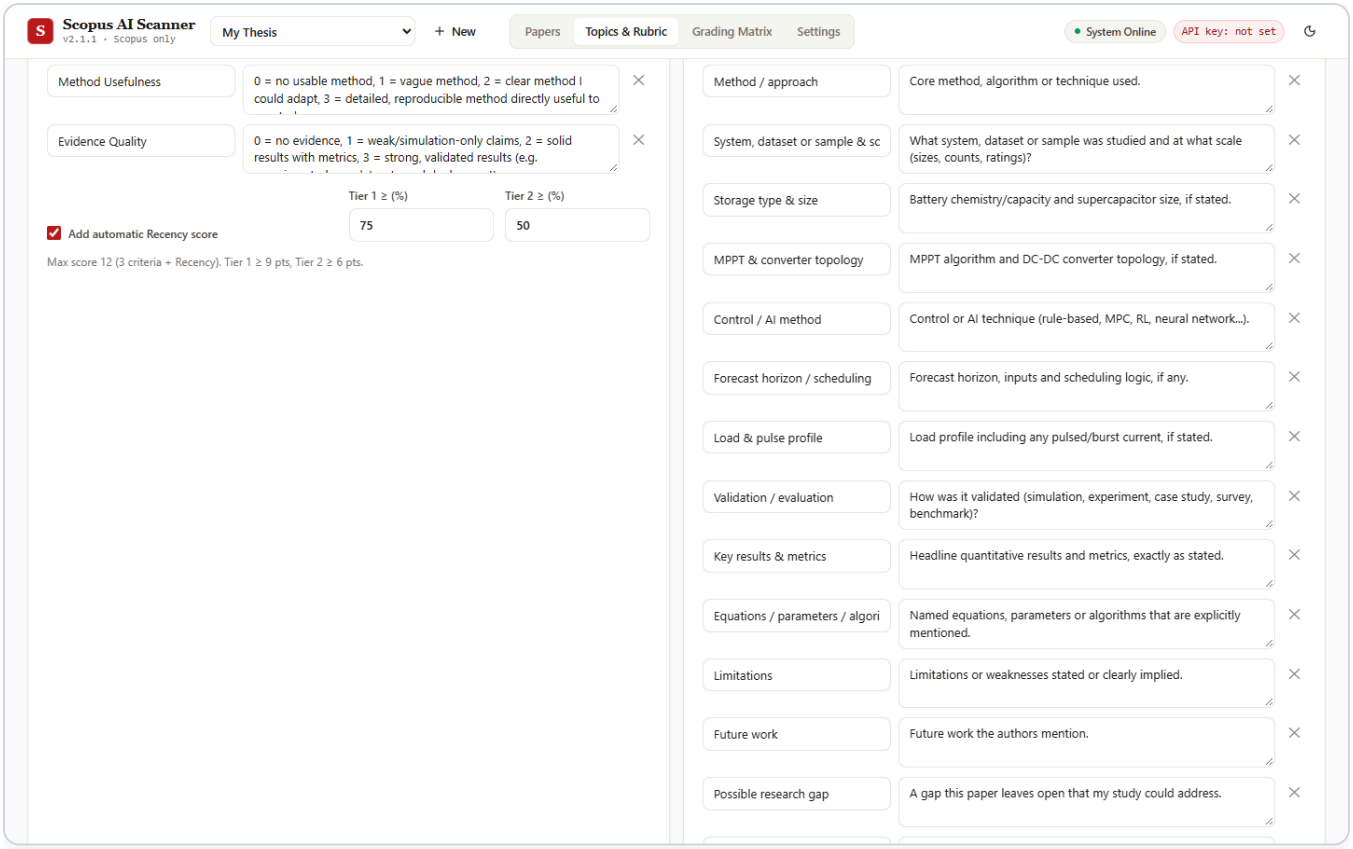

Figure 3 — Customizing the 0–3 rubric criteria, Tier cutoffs, and 15 deep-note extraction fields.

Step 4 — Bulk-Scan 100 Papers on Scopus (Zero Mouse Interference)

1. Log in to **Scopus** through your university or organization account and run your topic search.
2. Change the page size dropdown from 20 to **100 results per page** so you can scan a full batch at once.
3. Look at the bottom-right corner of the Scopus page: the ⚡ **Scopus AI Scanner V2** pill automatically detects how many papers are currently rendered.

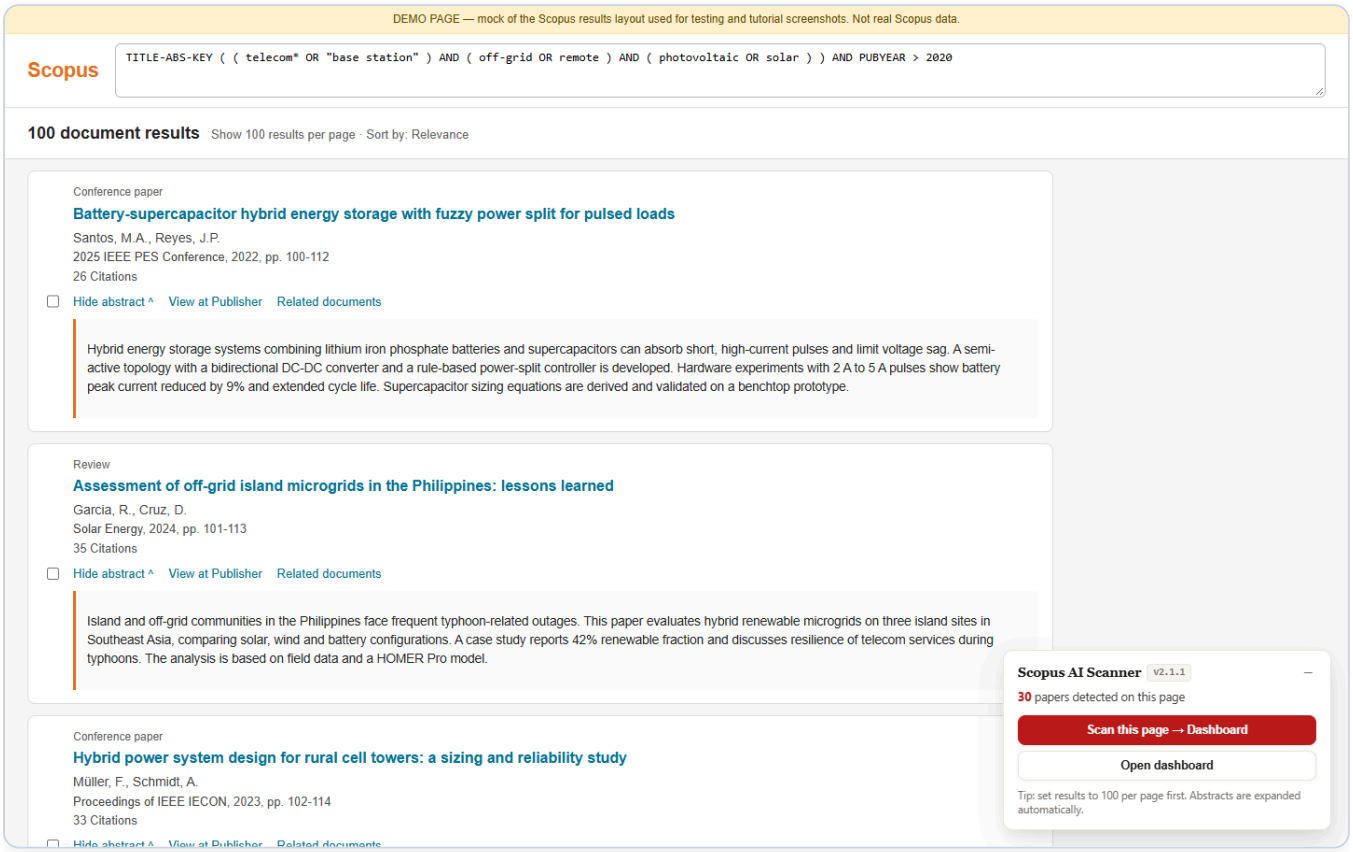

Figure 4 — Scopus search results page with the non-intrusive floating scanner pill in the bottom-right corner.

4. Click **Scan this page → Dashboard**. The extension automatically expands collapsed *"Show abstract"* sections, scrolls through the page to trigger lazy-loaded results, and extracts the Title, Authors, Year, Journal/Conference, Citations, DOI, and Abstract.
5. **Keep using your computer:** The scan runs strictly inside the Scopus tab's DOM—you can switch to another tab, write in Word, or use your mouse normally while it finishes.

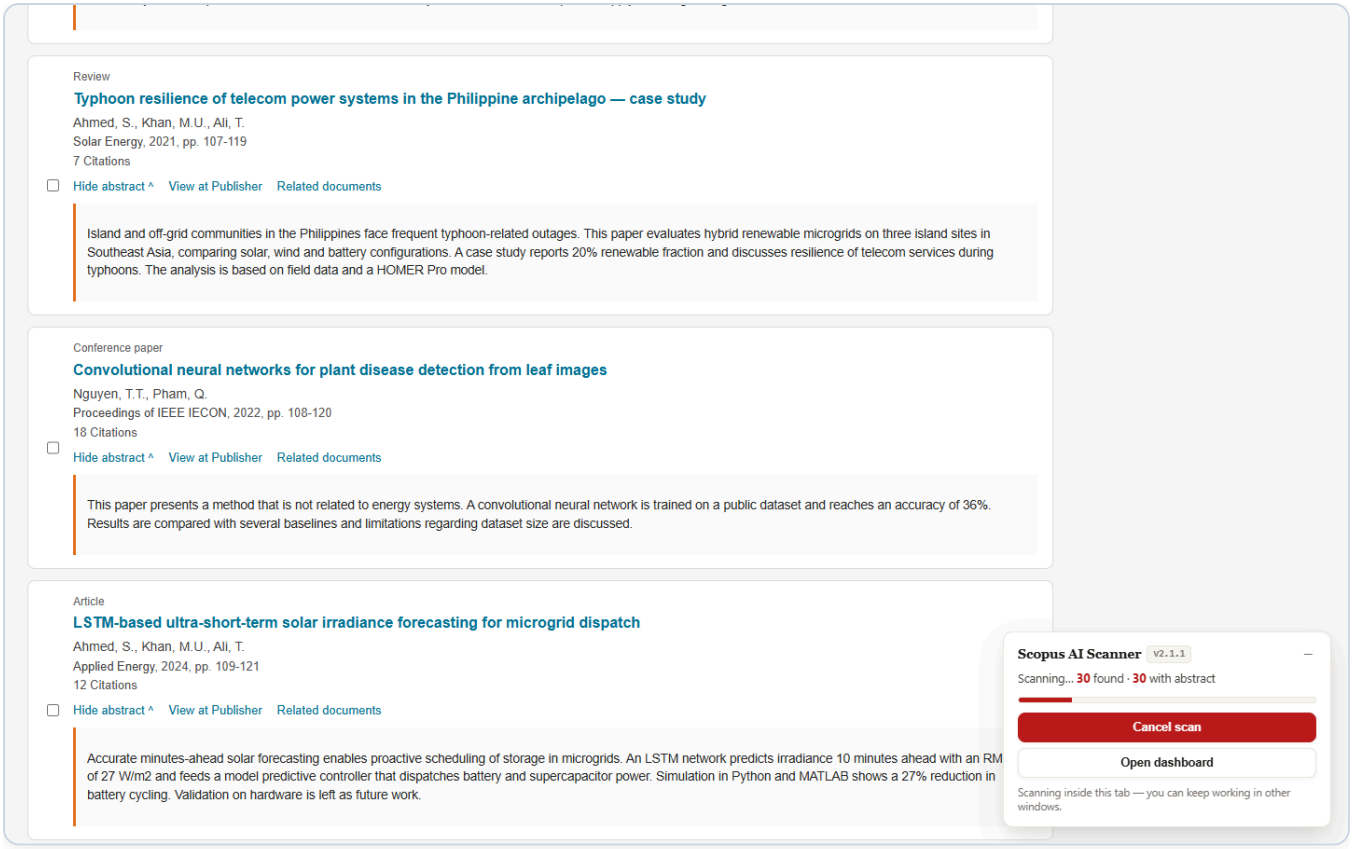

Figure 5 — Live progress bar while scanning and expanding abstracts across the page.

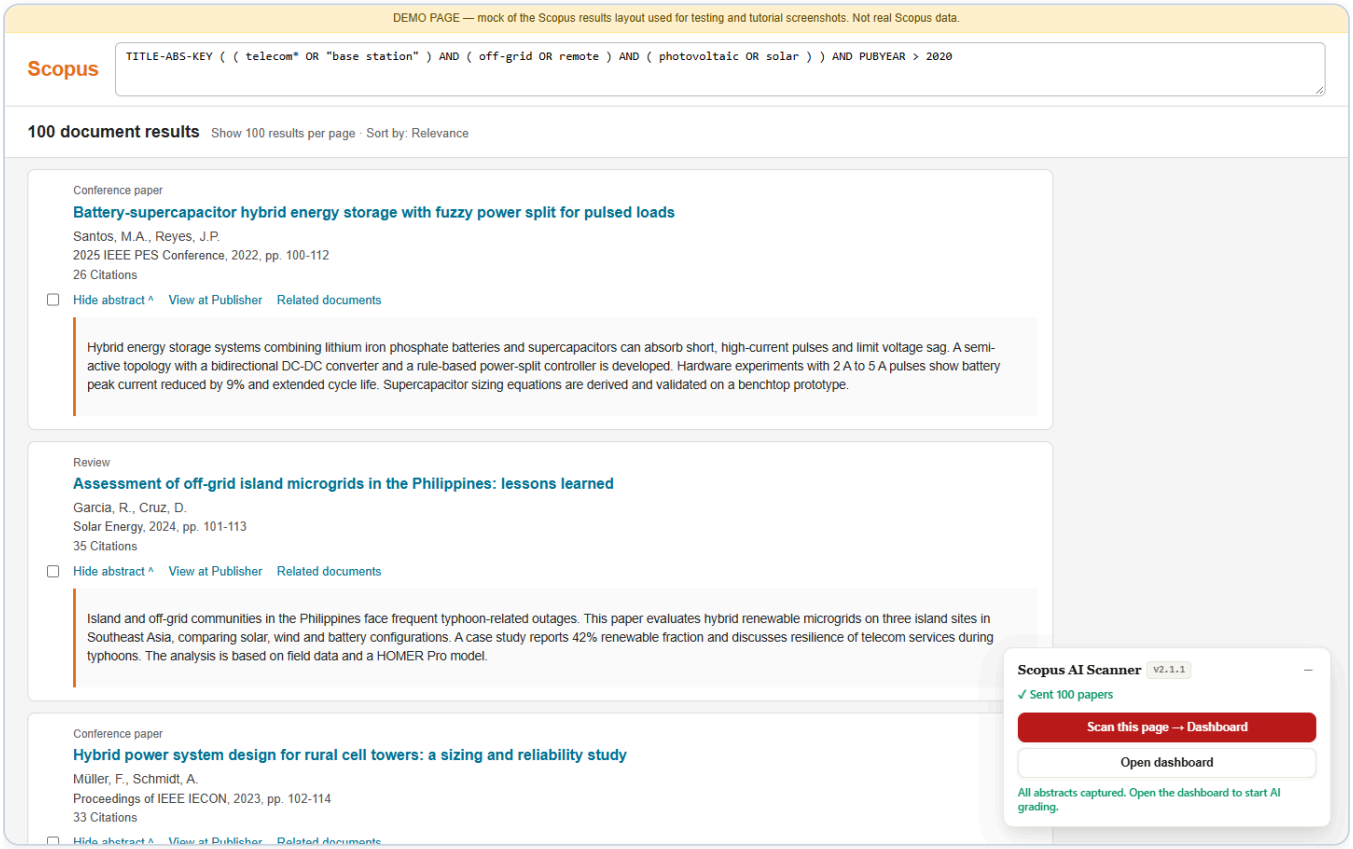

Figure 6 — Scan complete: all 100 papers and their abstracts have been sent to your local dashboard.

Step 5 — Preview Imported Papers & Run the AI Evaluation Queue

Switch to the **Scopus AI Scanner V2 — Dashboard** tab (it opens automatically in the background when you scan):

- **Instant keyword preview:** Even before calling the AI, each paper shows colored topic chips indicating how many of your topic keywords appear in its title and abstract.
- **De-duplication built in:** If you scan the same Scopus page twice, existing papers are skipped automatically.
- **Start grading when ready:** Review the list (or select specific rows with the checkboxes) and click ▶ **Start AI evaluation**.

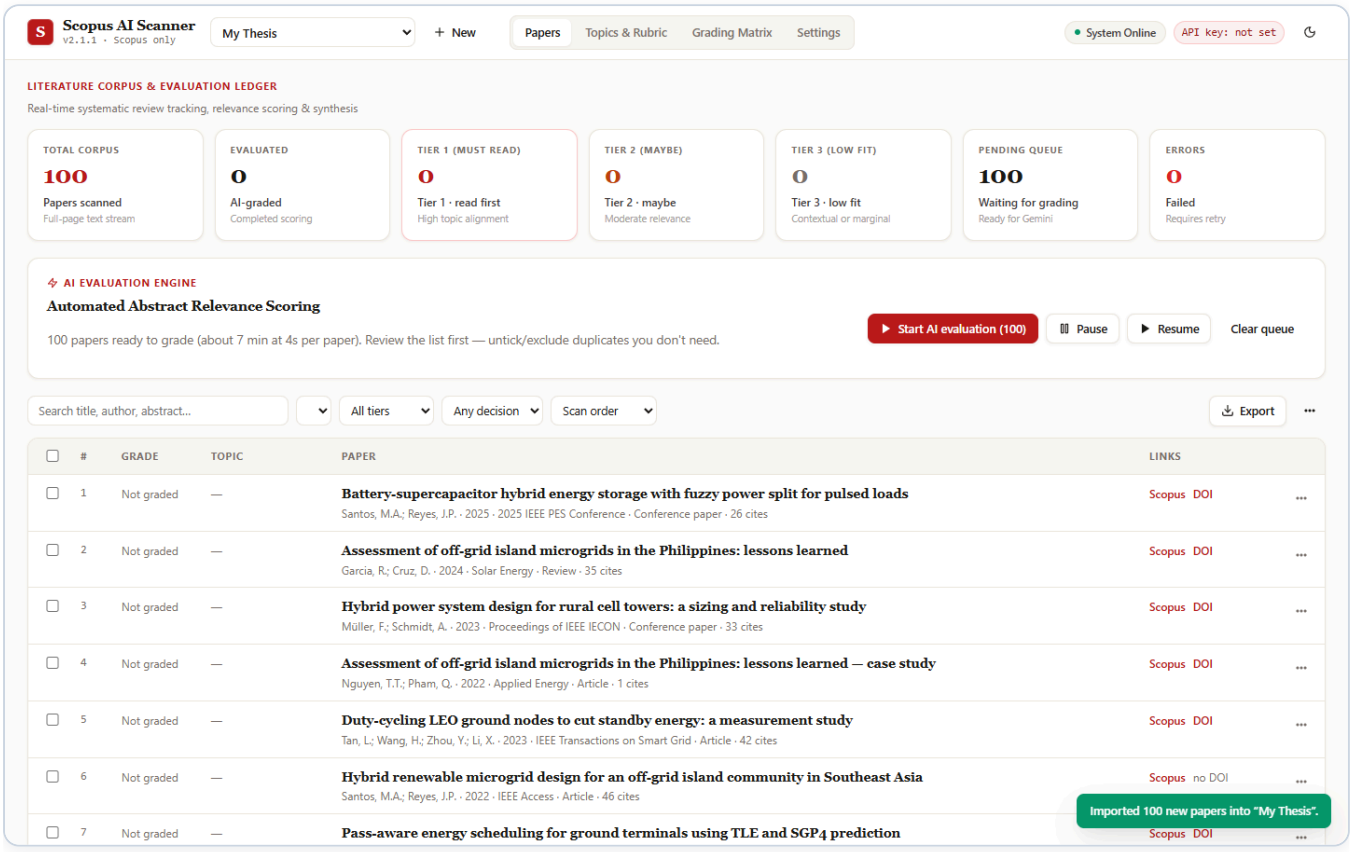

Figure 7 — All 100 scanned papers previewed in the dashboard before starting the AI queue.

> **How Pacing Works on the Free Tier:** Google AI Studio's free tier allows 15 requests per minute. The queue spaces requests by 4 seconds (~6.5 minutes for 100 papers), saves every paper to IndexedDB immediately after it is graded, and lets you **Pause** or **Resume** at any time.

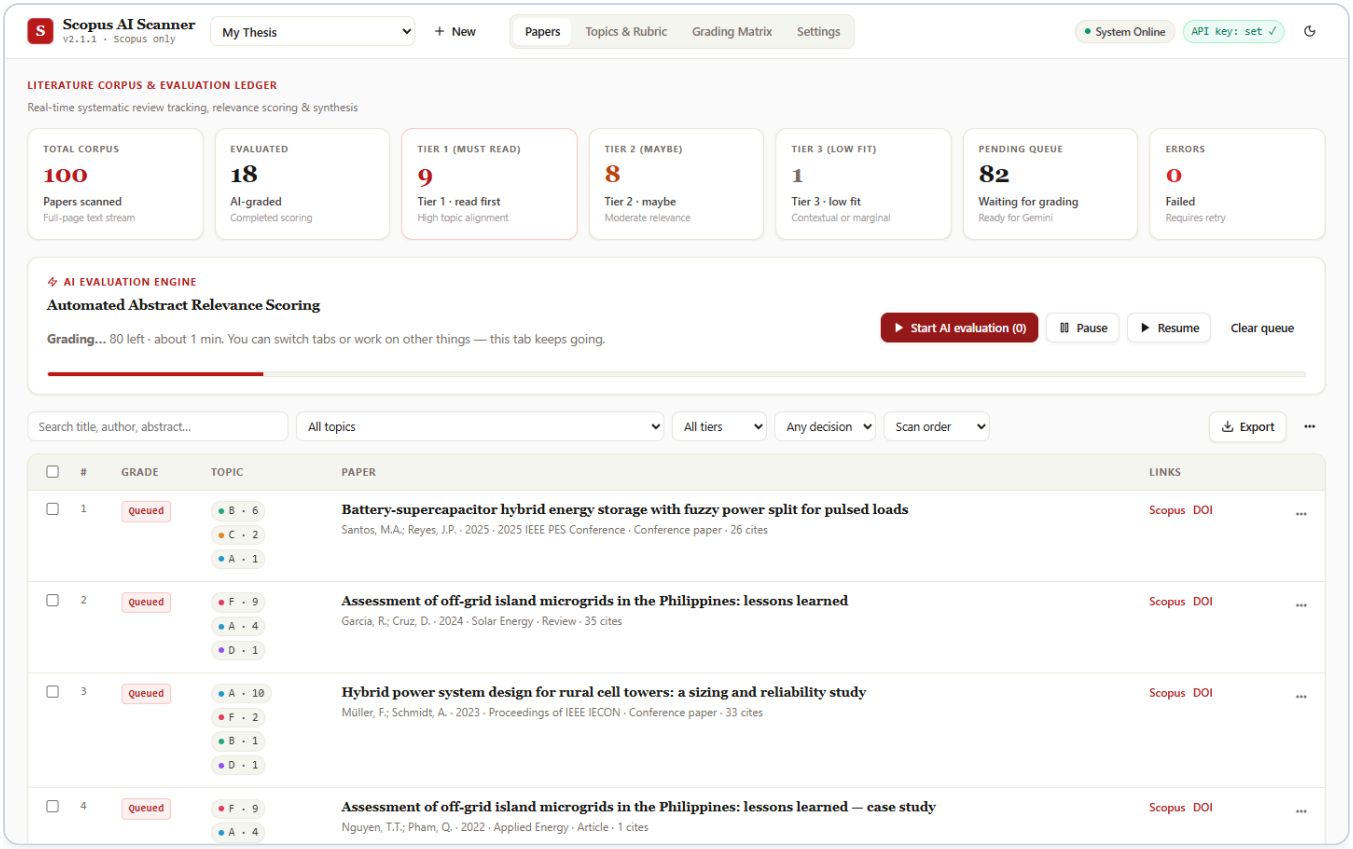

Figure 8 — The AI evaluation queue grading papers in the background with a live progress bar.

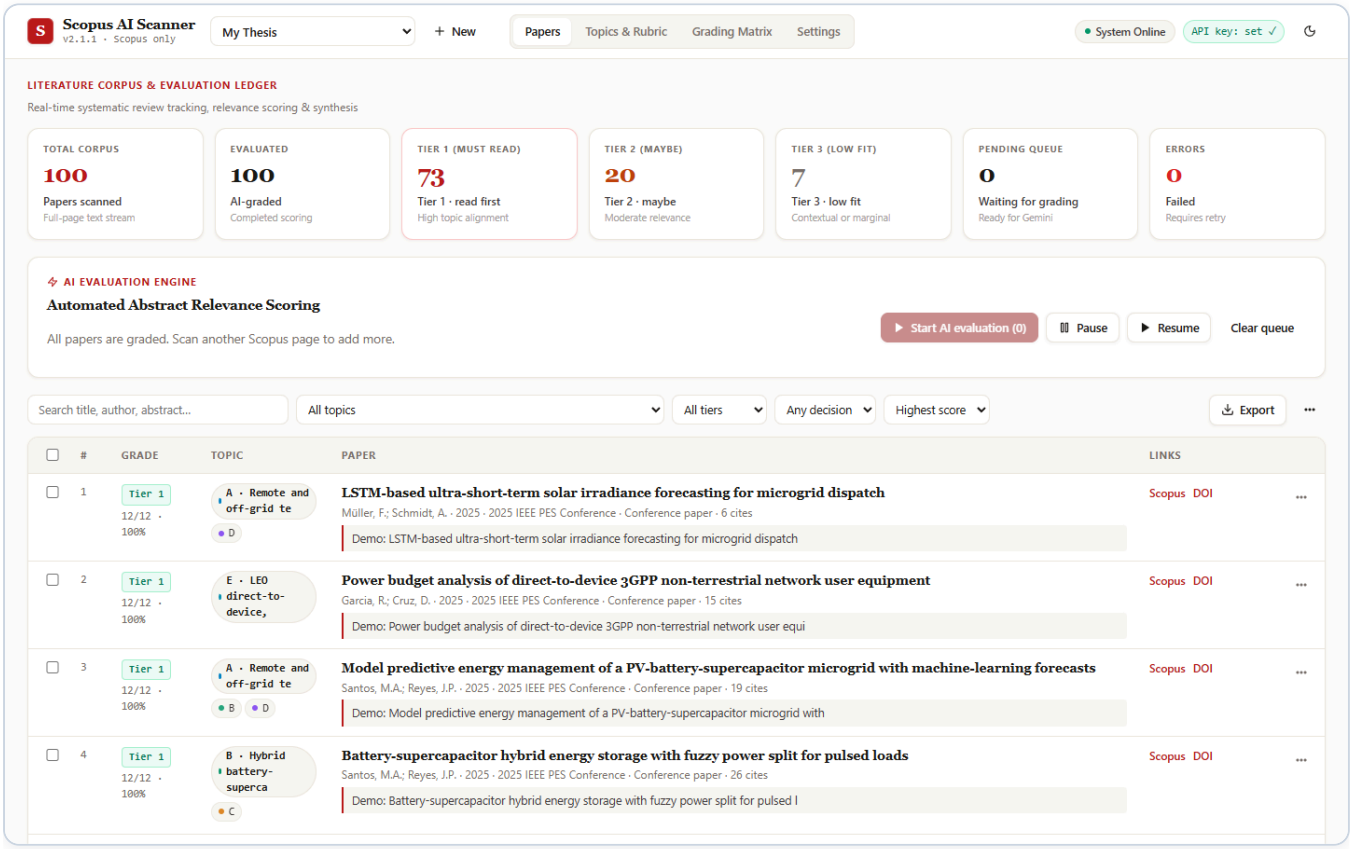

Figure 9 — Graded results sorted by highest score, showing Tier badges, percentage scores, best topics, and one-sentence summaries.

Step 6 — Inspect Deep Notes & Record Your Screening Decision

Click any paper's title (or the ⋯ button on the right) to open the full inspection modal:

- View the 0–3 score bars for each rubric criterion and the 0–3 relevance score for each of your topics.
- Read all **15+ extracted deep-note fields**. Whenever a detail is not mentioned in the abstract, the AI writes `not stated in abstract` instead of guessing.
- Set your manual screening decision (**Include**, **Maybe**, or **Exclude**), type your own notes, copy the paper's **BibTeX** citation, or look up a free Open-Access PDF via Unpaywall.

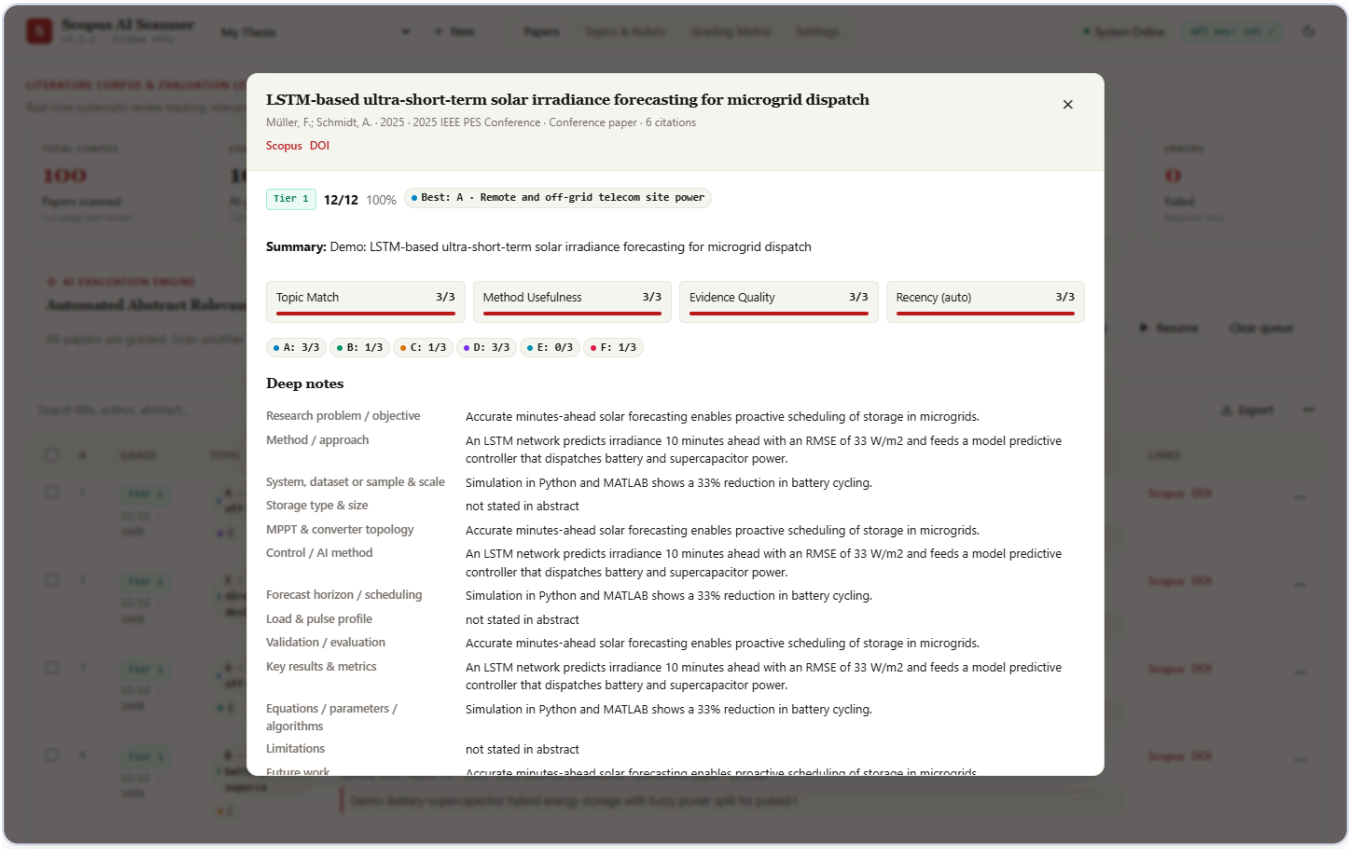

Figure 10 — Paper detail dialog showing rubric breakdown, per-topic relevance, and 15 extracted deep-note fields.

Step 7 — Analyze the Per-Topic Grading Matrix

Open the **Grading Matrix** tab to see how your literature coverage is distributed across your thesis topics:

- **Summary table:** Shows how many *Tier 1*, *Tier 2*, and *Tier 3* papers belong to each topic, along with the average percentage score and a visual distribution bar.
- **Paper × Topic Relevance Heat-Map:** Every graded paper is listed with its 0–3 relevance across all topics so you can immediately spot cross-cutting papers that bridge two or more chapters of your RRL.

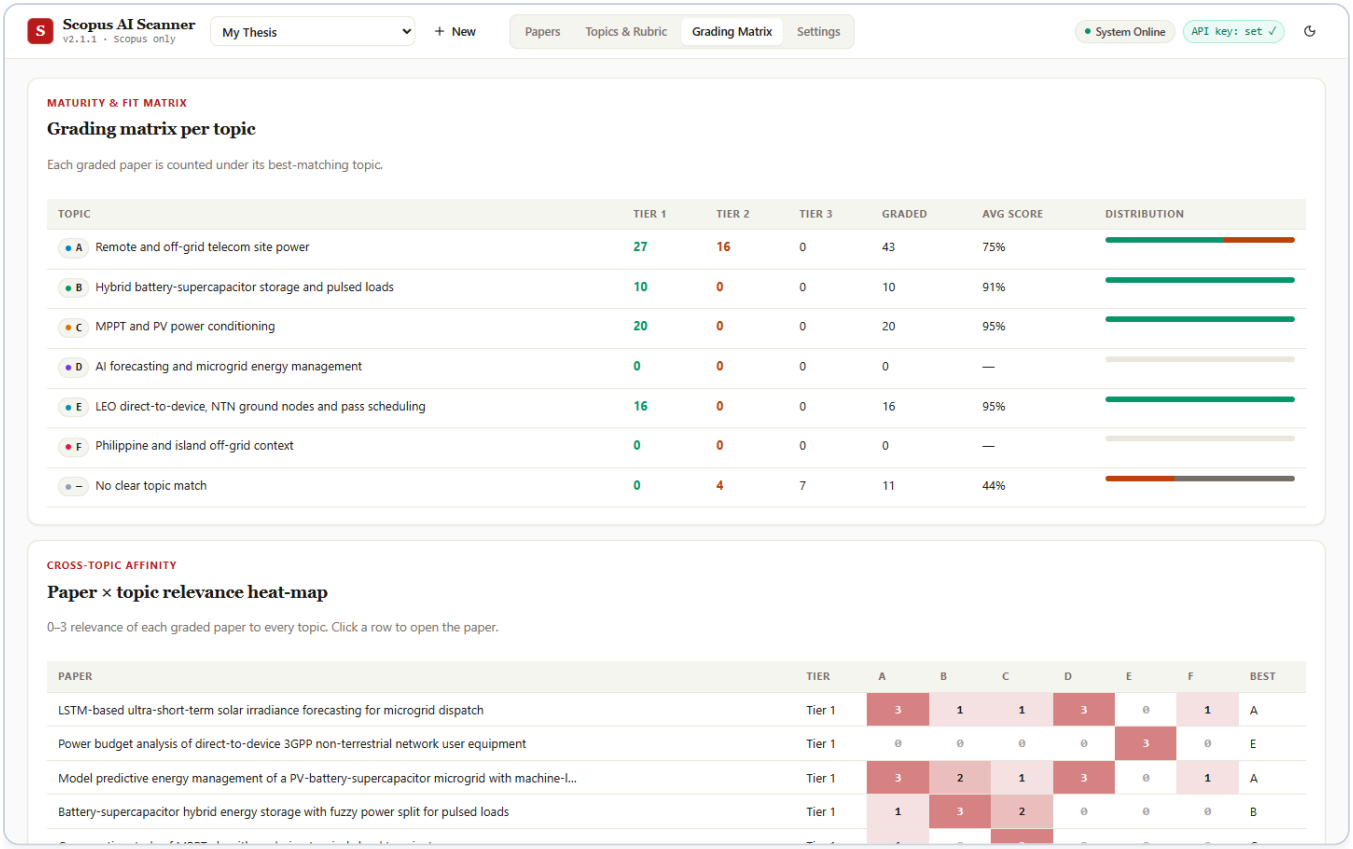

Figure 11 — Per-topic Grading Matrix and Paper × Topic relevance heat-map.

Step 8 — Export to Excel (.xlsx), CSV & BibTeX + Dark Mode

On the **Papers** tab, click **⬇ Export ▾** to download your screened literature in one click:

- **Excel workbook (`.xlsx`):** Contains 5 sheets— `Screening` (with live Excel formulas for Recency, Total, Percent, and Tier), `Topic Matrix` (with live `COUNTIFS` and `AVERAGEIFS` formulas), `Deep Notes` (all 15+ extracted fields), `Topics & Rubric` , and `Settings` .
- **CSV (`.csv`):** UTF-8 CSV ready for Google Sheets, R, or Python pandas.
- **BibTeX (`.bib` or clipboard):** Clean `@article` / `@inproceedings` entries ready to import into Zotero, Mendeley, or Overleaf/LaTeX.

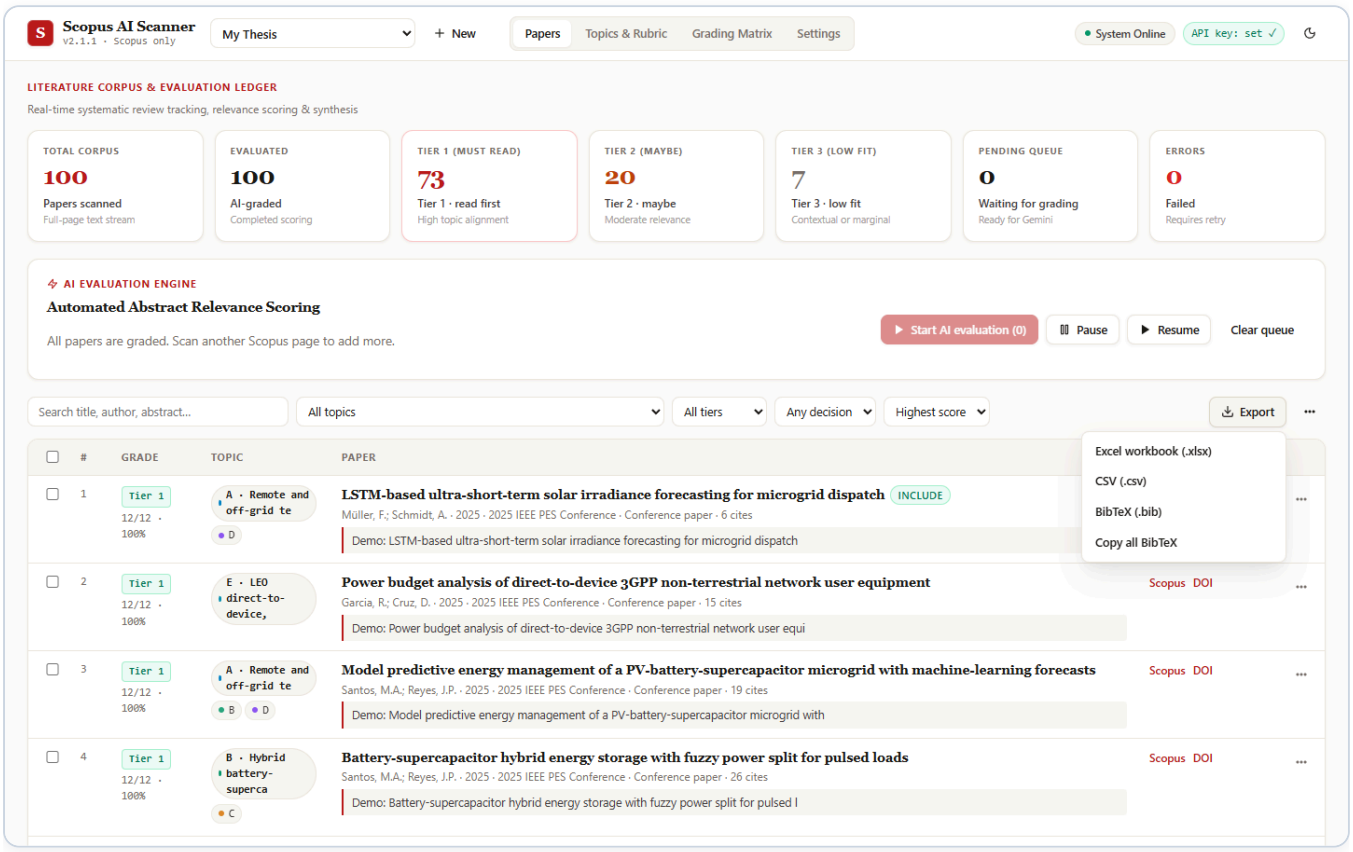

Figure 12 — One-click export menu for multi-sheet Excel (.xlsx), CSV, and BibTeX.

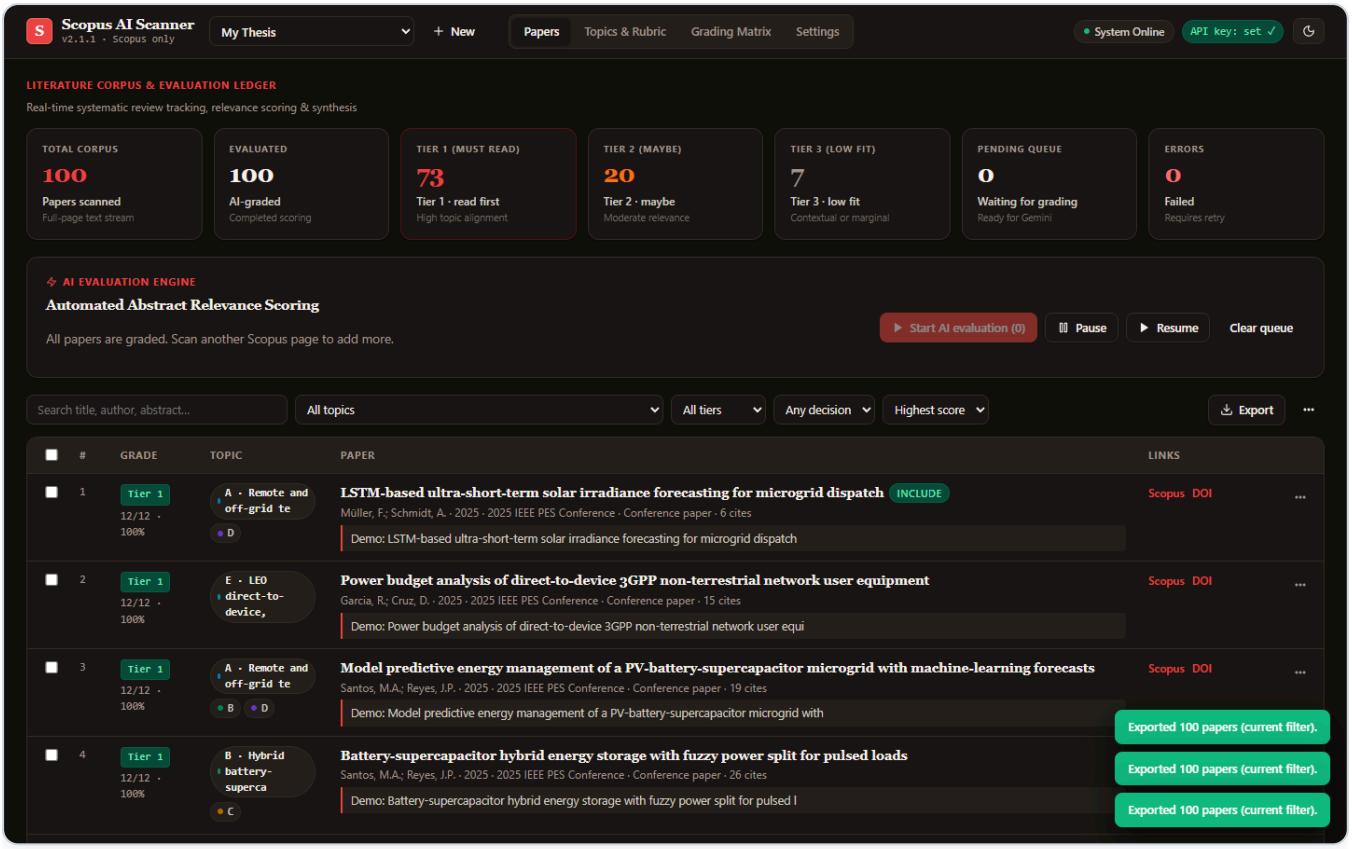

Figure 13 — Toggle between Light and Dark academic themes at any time using the button in the top bar.

Troubleshooting Tips:

- **Accessing Scopus via a university proxy URL?** If your university rewrites the domain (e.g., `scopus.com.ezproxy.univ.edu`), click the extension icon in the toolbar and click **Show scanner on this tab**.
- **Missing DOIs on some cards?** On the Dashboard Papers tab, click ⋯ → **Find missing DOIs (CrossRef)** to resolve them automatically from the title and year.
